Heat transfer valves are often used to control the flow of fluid in heat transfer apparatus, such as cooling coils. Most valves in use today, however, are mechanical and depend on the rotation of a tube about its longitudinal axis to control flow. In operation, the tube rotates in one direction to open a port and in the other direction to close the port. Often, the port in these devices is not capable of making a fluid tight seal. Therefore, the valve must be fitted with a mechanism to ensure that the tube is fully closed and sealed before assembly of a plumbing fixture. With this in mind, U.S. Pat. No. 5,462,017 to Stevens discloses a rotational valve with improved reliability by ensuring that the tube in which the valve mechanism is housed is fully inserted into the valve housing before the valve is closed. Rotational valves are not without their drawbacks. For example, air must often be used to help the valve mechanism slide within the tubing. This increases the size and complexity of the housing which is usually in the range of about 0.5" to 1.5" in diameter. In addition, the valves in use today have sealing rings which are repeatedly stressed and must be replaced relatively frequently. This increases manufacturing cost and the frequency that replacement parts must be stocked. Another drawback is that most rotational valves are exposed to high temperatures, often around 400.degree. F. as required to heat the fluid flowing through the tubes. Exposure to elevated temperature reduces the service life of the valve and increases the risk of component failure. Moreover, the components of these valves are made of thermally conductive metals which are relatively expensive. In view of the above, it is an object of the present invention to provide an improved rotational valve, particularly one without the need for external air pressure, which is simpler to use, lighter, and less expensive to manufacture. Another object is to provide a valve which has a longer life and a reduced risk of component failure. Still another object is to provide a rotational valve which operates at a lower temperature than most currently used valves. Additional objects and advantages of the invention will be set forth in part in the description which follows 3e33713323
