History Early History (1982-1988) Autodesk began the development of AutoCAD in 1982, to meet the needs of civil engineers who were designing large-scale industrial construction projects. The first version of AutoCAD was a small desktop application that was sold to a small number of business customers. The first version of AutoCAD was still the same as the first widely-released version of AutoCAD today, which was released in December 1982. The first release of AutoCAD required a microcomputer with an internal graphics controller with either 640x350, 640x400 or 640x480 resolution graphics modes and a 24-bit color display. In 1986, Autodesk began the business of AutoCAD Map, a mapping and satellite imaging product. Autodesk is highly protective of the trademarks and copyrights they own, even after they sell the company. Because of this, information about the development of AutoCAD in the early years is scarce. Autodesk AutoCAD Version 3.0 was the first major version of AutoCAD that added a shared data library, allowing users to share data on the fly as they worked. This included geometry, and editing, among other things. This allowed a user to design a project using one AutoCAD session, and share it with other users in other sessions. Another major release of AutoCAD was AutoCAD 4.0 in 1989. Design and development of AutoCAD took about ten years. 1990s AutoCAD 2.0 was released in 1990, the first version of AutoCAD that had built-in rendering capabilities. AutoCAD 2.0 was popular among engineers because it provided a more efficient method of working with large-scale drawings. This new type of user interface, with detailed graphics and three-dimensional representations, was designed to make the user more effective at a wide range of engineering projects. AutoCAD continued to evolve over the next 15 years. In 1995, AutoCAD 2.5 added the ability to create parametric surfaces. In 1997, AutoCAD 3.0 was released, with the ability to create dynamic layouts and 2-D engineering components. With the release of AutoCAD 4.0 in 1999, AutoCAD became an add-in program. 2000s In 2001, AutoCAD 3.5 was released, with powerful 3-D

The use of optical fibers is now so widespread that it has become a standard feature in most homes and businesses. However, the need for providing access to network connections has resulted in a demand for network connectivity in places where normal power lines or phone lines could not be used. This need for network connectivity has resulted in the development of a number of prior art methods for providing network access in hard to reach areas. In many of these applications, the network connections are accomplished using wireless links. This is primarily due to the inherent flexibility of wireless links. Since the access point is not tethered to a fixed power source, the access point may be moved to any convenient location that has access to a wireless network. One such prior art application is disclosed in U.S. Pat. No. 6,429,935 to Mullaney et al., the entire contents of which are hereby incorporated by reference. Mullaney discloses a method for providing wireless local area network (LAN) access to a wireless host system in which the host system provides the data transmission link for the wireless LAN. The wireless LAN access point is tethered to a power source and is located in an area that is inaccessible to normal communications means such as telephone and power lines. Another prior art method for providing network access is disclosed in U.S. Pat. No. 6,373,127 to Hinkle et al., the entire contents of which are hereby incorporated by reference. Hinkle discloses a wireless LAN access point that includes a main control and data processing module and an antenna assembly. The main control and data processing module receives the wireless signals from the wireless LAN access point. The main control and data processing module then transmits the wireless signals to the host system using a wired communication line. A problem with the prior art is that the wireless link from the access point to the host system must be established prior to the establishment of the link to the internet, other network devices, and the like. Accordingly, what is needed is a system and method for providing network access using a wireless link that overcomes the problems associated with the prior art. Because of its geographical position, Croatia is a hub for many of the world's largest corporations: IT companies from all over the world build data centers here to better utilize the Mediterranean Sea as a natural data center pool. The companies are mostly concerned with reducing the distance between the data centers and the clients who require their services. To solve this problem, Hibernation (www.hibernation.hr)
