SingleCrystal Cracked Accounts is a comprehensive application that can display simulated X-ray, neutron and electron diffraction patterns, using several consecrated techniques. Can be a highly useful teaching assistant The program is valuable mostly for Chemistry and Physics students and professionals. The ability to generate stereographic projections makes it a particularly useful tool for teachers. Anyone passionate about crystal diffraction patterns will also draw value from it. SingleCrystal features a multi-tiered interface that relies on several frames. Numerous menu items are also present, and all these things considered might entitle one to deem the program's interface as complex. Newcomers should persevere, however, as graphical representations are highly informative and most menus only deal with fine-tunings. Displays detailed stereographic projections The resource can load multiple types of files, from specialized, program-specific graphics documents to common images, such as GIFs, JPEGs, BMPs and PNGs. Once a valid file has been loaded, the program will display the crystal, complete with a stereographic projection. This is the core function of this utility, as it allows one to view the angular positions of vectors. For even more accuracy, one can load a diffraction image and compare the resulting patterns. The reflections can be labeled and the software allows users to measure parameters between diffraction spots, such as distances and angles. Allows one to export projects to more common formats Users are free to rotate the source crystals, which allows one to actually get a sense for the angles and distances mentioned above. The tool also allows users to save their sessions, as well as to export projections to pixel or vector based formats, for quick dissemination. All in all, SingleCrystal is a comprehensive program that can be especially useful for anyone studying crystal diffraction patterns. SingleCrystal is a comprehensive application that can display simulated X-ray, neutron and electron diffraction patterns, using several consecrated techniques. One of my highly busy weekend projects is to take a look at what's changed (or doesn't) in the new (or old) 'out-of-the-box' module. Some of the changes are things I want to change, others are things that I already knew were going to have to be changed in some way. I don't think I'll ever update the module myself, so if anyone wants to take it over and do it themselves - please feel free to get in touch. There's a few things that I want to mention before I jump into what's changed or done. Firstly, I want to start by saying a big thank you to everyone who has read my blog and sent me email asking "What's changed in the new module?". Without your emails I wouldn't have been able to keep up with all the things that had changed. Secondly, I'm very conscious of the fact that you guys (the tens of thousands of FreeCAD users) own this module. Making my own decisions about changes and additions without consulting you is a bit like the elephant in the room, the elephant being that we're both using the same tool but with completely different interpretations. Thirdly, while I don't think I'm the only person who has read my blog and kept an eye on my emails, I know that I'm the only person who has spent the time to take all

the emails in and pull them together, so the blog isn't meant to be a reflection of what I think it's meant to be, it's more like a "who's this" with FreeCAD and some more general thoughts about how it works. So what's changed? Here's a list of all the changes that the module team made in the new module: CSS-based framework that makes it easier to add the various tools for drawing diffraction patterns Separated out the procedures used to draw the simulated diffraction patterns Automated procedure to read the diffraction image from the file and translate it into the drawing A new procedure that lets you translate an error bar and obtain the error limits needed to draw the error bars Automated procedures to automatically add the error bar lines A new procedure to automatically set the line properties New procedure that enables you to rotate the picture based on the 2D vector
