===== Sobel filter is a fast and accurate edge detector. It is used to detect any line-like edge in an image. A Sobel filter consists of two separate components: - A 4x4 convolution filter in which each pixel in the image is multiplied by a pixel in the filter. - An intensity value that represents the sum of the product of the filter with the pixels in the image. The Sobel filter steps are: - *1).* Divide the input image into 8x8 blocks. Each block has 4x4 pixels. - *2).* Calculate the neighboring pixel's 4x4 filter according to the weight and stride. - *3).* Convert the normalized weights to the original input space to calculate the 1x1 and 2x2 convolution values. - *4).* Calculate the intensity value for each pixel. - *5).* Extend the intensity values to the new size of the image. - *6).* Set the result as the new image. Applications ===== ** 1.
