analysis software for finite-element analysis of electrostatics Maxwell's equations and other electromagnetic problems. The Maxwell solver
module calculates the electromagnetic fields for one or more parts of an electronic system. The purpose of electromagnetic analysis in
Maxwell's equations is to optimize the design and performance of electronic systems, including computer circuits, antennas, and optical
devices. Maxwell's equations are described in the Maxwell's equations chapter of the Physics and Computer Graphics text. The Maxwell
solver uses a finite-element approach that requires the system to be subdivided into small parts called elements, with the fields at each element then
calculated using the finite-element method. The Maxwell solver solves the transmission, Maxwell's equations: Two regions, each in free space,
are used to solve Maxwell's equations for the scalar potential and magnetic induction. Areas of uniform cross section, consisting of closely
spaced cylinders, are used to solve Maxwell's equations for the displacement vector. The Maxwell solver also solves the vector equations: The
vector potential, magnetic induction, and the electric field in a given region are calculated using a boundary element method. Boundary elements are
parameterized surfaces that map the surface of the device into a common, homogeneous, region. The boundary element method is also used in the
section on the Lorentz force where the equations of motion are written for each boundary
