This article gives a brief overview of how Photoshop works to help you understand how to use it. What Are Image Files? In the 21st century, your computer will probably store your images in a digital format, such as TIFF or JPEG. But if you're an artist or graphic designer, the images you create for your computer are most likely in a separate file type that Photoshop can't use — a proprietary image format known as AI, or Adobe Image. You can open these files in Photoshop if you add the right software or use a photo editing website that supports those formats. But you can't edit the images inside, and you need special software to save them back to the same format if you want to move or print them. These file formats have a look very much like the electronic version of a photo camera roll. The image in the file is stored as a series of numbers representing color and tone, and the name of the file typically gives the location of the image, the date it was taken, and sometimes even the name of the photographer or the subject. The most common file formats are TIFF for images saved in 24-bit color, and JPEG for images saved in 8-bit color, and JPEG 2000 for images saved in any color depth. TIFF and JPG files are easier to work with for most people, and standard files always work in a browser. However, the newer JPG 2000 and TIFF/EP technologies are more versatile and can store up to 256 layers of graphics, which are not supported in traditional JPG or TIFF files. Adobe Images Photoshop gives you four different formats of Adobe images (AI, EPS, PSD, and PSB), and two file types for its Smart Objects — an EPS format (.eps) and a PDF (.pdf) file. The files.psd and.psb are not file formats that Photoshop recognizes. The Adobe software comes with built-in tools to help you manage your images and convert them into the four new formats, including an AI image conversion tool and a PSD file format manager. If you don't have the Adobe software, you can also download the free raw converter from Adobe to convert your JPEG, TIFF, and RAW image formats to Adobe formats. Adobe File Types AI The AI file format is a standard for digital imaging tools, such as Photoshop, that is backwards-compatible with older file formats.

Photoshop Edit Start Photoshop Elements and click "File". The "New" option is under the "File" menu. You can also click the "New" button in the top-left corner of the app. In the New window you should see two tabs. The left one is titled "Photo". To create images, click on this tab and then choose "Edit Images" from the menu below it. You now have two options to edit the images. You can click "Select" or the "Open" button. If you select images for editing, you can either go to them by navigating using the "Go To" button at the bottom of the menu or by clicking the image in the "Photos" area. Alternatively, click the "Open" button. You should see a small, white window on the left side of the "Image" window, underneath it. You can then click "OK". You should now see the image in the "Photo" tab. This is your starting point. Below it are four menu tabs: Adjustments, Doodles, Apply and Enhance. You can adjust the image in the Adjustments menu by sliding your mouse along the different buttons. You can find the different buttons on the left side of the Adjustments menu. You should now notice the Doodles area on the right side of the image. You can draw any image or text in this area. There are a number of tools here for you to use. Most of them are similar to those in Photoshop, but with different icons. You can draw text using the Pen tool to write or highlight text. You can also change the color of selected text using the Color Picker. You can add a drop shadow (shadow) to your text using the Shadow tool. You can change the color of your text by double-clicking on it with the Pen tool. You can also draw with the Brush tool. You can use it to draw a line or add a line to your picture. To do this, click on the top left of the Brush tool until the icon switches to a different color. You can also add a color gradient to your picture. Click on the tool icon and then select a color from the color palette on the right of the 05a79cccf7

A new report from the "Treasury Select Committee" published today exposes the true cost of the UK's military intervention in Syria to be at least £2.4 billion, not to mention, more than £5.6 billion. In addition, that is more than four times what is projected to be spent on the Trident nuclear programme. For a bit of context, just over £46 million has been spent on airstrikes against ISIS-held territory in Syria. The Costs of Britain's Syrian Intervention, conducted by the "Committee of Public Accounts" ("PAC") based on the "Criminal Finance Act 2015" and "Permanent Service Indemnity Act 1939", could be a little dry for some, but for anyone working in the public sector, it is a sobering read. It is an oversight that information on the UK's current war effort must be kept out of reach of the civil service due to the Official Secrets Act. The report also calls for the English "Offences of Access to Official Secrets" to be updated so they can include the modern digital world. Let's unpack the report: £1,071,400 for the RAF's "tactical transport aircraft", which can be converted into a gunship £207,200 for "briefings and advice to US Department of Defense officials" £1,000,000 "to a wholly-owned subsidiary" £761,504 for support "in providing training to pilots from the United States and Australia to fly RAF aircraft" £1,000,000 for the "organisation and delivery of support for the RAF's work in Iraq" £1,000,000 for "ongoing intelligence liaison and assistance" £1,000,000 for a "contractual study" £1,000,000 "for the provision of support services to a wholly-owned subsidiary" £786,880 for "operational costs" £756,000 for "contracts and related costs" £73,300 for "station accommodation and associated costs" £72,000 for "telephone"

Q: django rest framework and model fields I am using Django and DRF to create API web services. I have a model called "CustomerOrder". The fields "start_date", "end_date" need to be shown when retrieving the customer orders by ID. Normally for database fields I'd specify a "related_name" in the model. How can I do it with DRF and what is the best way to do it. I am aware of including other fields with json serializer and retrieving it in the view { "start_date": "2016-01-01" "end_date": "2016-01-31" } return { "orders": serializers.OrdersSerializer(data={ "start_date": "2016-01-01" "end_date": "2016-01-31" },) } How does this relate to the database and retrieve the same results? A: I suspect that you may want to use serializer.data rather than a ListSerializer, if this is the case, you should just define the two fields in the serializer, not wrap them with a serializer: { "orders": [{ "start_date": "2016-01-01", "end_date": "2016-01-31", }] } Then in your view, you can access them using serializer.data.orders[0].start_date, for instance.
