In order for Hitman 2 to be playable, you need to make sure to download and install the latest NVIDIA drivers. . This. Want to have fun? A vast selection of titles, DRM-free, with free goodies, and lots of pure customer love. Q: How to do an update in PySpark on multiple columns/columns excluding some columns? I have to perform a update on one row in a Spark SQL table (in PySpark). The table is: name | lat | long | remark | remarks | sdfi ----- aa |xx.XX|xx.XX|remarks\_0 |SDFI My requirement is that I want to remove all the columns except the ones mentioned in the remark column. I tried SELECT \* FROM localite where remark=remarks\_0 The table is new and there are no data as of now. This query has been in a trigger on another table. The result of the above query is: name | lat | long | remark ----- aa |xx.XX|xx.XX|remarks\_0 I tried to add the remaining fields in the SQL statement like SELECT \* FROM localite where remark=remarks\_0 and remaining\_fields but the exact same table gets returned. How can this be done? A: In this case simply use PARTITION BY ROW() instead of SELECT \*, since the intention is to only change one row in the table and not all of it. A: In addition to @evanmacarol's answer, you could also use the spark-submit scala method of Read.withColumnRenamed: public Read withColumnRenamed(cols: java.util.Set[String], colsPrefix: String)(f: (String, String) => String): DataFrame With new column names. Renames the existing columns of this DataFrame with new column names. val sqlContext = spark.sqlContext val df = spark.read.csv("c:\\Users\\Utility\\asdf.csv") val df2 = df.withColumnRenamed("\*","new\_name") To
