In this article we will see some of the basic to intermediate techniques that are available in Photoshop Elements. These can be used by both amateur and professional. CC Photo Studio has much of the functionality you need for creating your own images in Photoshop Elements. If you are using a laptop or other portable device, we recommend using a desktop version of Photoshop Elements, but you should still be able to read these instructions. Photoshop Elements has a lot of other features that we have not discussed in this article. For example, it has a Magic Wand tool to select images or add objects to them, a motion blur filter to blur images, an excellent noise reduction filter, layer functions, warping, perspective correction, and much more. So, let's get started. Select your subject Select a subject using one of the techniques discussed below. Source: Flickr Freehand selection Freehand selection in Photoshop Elements is a simple, but powerful tool. You can also use the brush tool to make the selection. Freehand selection To select a freehand object, first load an image into Photoshop Elements. You can either use the file you want to edit, or a file that you have prepared with a graphic editor like Photoshop. Hold down your Shift key on your keyboard to make a selection without making a selection. You can also hold down the Ctrl (for Windows PCs) or Command (for Macs) keys to make an active selection around your mouse pointer or a series of mouse clicks. To select multiple areas, you can click and drag while holding down the Shift key. Create a selection using the magic wand tool The magic wand tool is the quickest and simplest way to select an object, or load an object into your image. Simply click and drag to select an object or an area of the image. When you release the mouse button, the magic wand tool will make a selection around the part you clicked. You can also use this tool as a quick alternative to the lasso tool. Click and drag with the magic wand to create a selected area. Lasso tool The lasso tool is a quick way to add an object or area to your image. To create the lasso tool you click with the left mouse button and drag along the edge of the selected area. When you release the mouse button, the selected area will be moved to the pixel you clicked. You 05a79cecff

Ocular thermoregulation at a constant retinal irradiance. A series of experiments were conducted to determine whether the thermal environment of the eye can be modified by changing the constant retinal irradiance to which it is exposed. The results were obtained in five dogs using surgical techniques that allow direct control of corneal temperature and retinal irradiance. A new parameter that is independent of changes in corneal temperature is proposed to describe the effect of constant retinal irradiance on the evaporative water loss from the eye. Measurement of this parameter indicates a greater than linear increase in evaporation from the eye with increasing retinal irradiance. We propose that this increase in evaporation is an important component of the sensory transduction process involved in thermoregulation of the eye.

Mueller's "Game of Thrones"-style indictment against Russian internet trolls Two weeks ago, the former special counsel Robert Mueller dropped a bombshell. His indictments of 13 Russian nationals for waging an elaborate social media hoax with the goal of sowing political chaos in the U.S. hit me like a sucker punch—it was, for those who don't follow this business, exactly what we've been waiting for. All 13 were charged with conspiracy to interfere in the 2016 U.S. presidential election in violation of federal law. They were more specifically charged with posing as Americans online, often with politically extreme or racist messages, and using fake accounts to communicate with people in the United States to “sow discord,” “influence elections,” and “spread propaganda.” “Facebook ads bought by Russians and targeted at US audiences appear to have helped Donald Trump's 2016 presidential campaign,” Business Insider reported. “The far-right ads made a particularly large impact on the 2016 election. Facebook ads served by the Internet Research Agency were used to reach 61.1 million US Facebook users in the lead up to the election. The majority of these users — 44.6 million — were reached as this network was aimed at sowing discord.” Those numbers are enough to make anyone's head spin, so naturally I wanted to dig deeper, and I started with the issue of what defines a “Russian” or a “Russian national,” the latter of which (in this context) can include anyone who is a citizen of the Russian Federation. So I quickly checked the Facebook ads

This invention relates generally to the field of holography. More specifically, the invention relates to a method of recording holograms by exposing light to a record medium, such as a silver halide emulsion, which has been treated to reduce or eliminate the sensitivity to the low wavelengths of the recording light. In the past, the fields of view and lens systems used in holography have been limited in the wavelengths of light that they can effectively accommodate. Holography typically uses low-wavelength light in the visible region. For example, recent work in the field of holography has been devoted to the red, green, and blue wavelengths of visible light, although holographic techniques have also been developed with respect to the ultraviolet range. The use of red, green, and blue light, however, has resulted in a limitation on the amount of holographic information that can be stored in a given volume of a holographic media. Silver halide materials have been used for many years as a photographic record media. In the past, some effort has been made to develop silver halide materials sensitive to different wavelength ranges. For example, silver halide emulsions designed for photography using the infrared and visible range of the electromagnetic spectrum have been described. These emulsions are usually characterized by the relative sensitivity of the emulsion to different wavelength ranges, as well as the sensitivity of the emulsion to exposure to different wavelength ranges. In the late 1940s and early 1950s, it was discovered that silver halide emulsions could be sensitized to light in the blue region of the electromagnetic spectrum. Sensitization of silver halide to blue light has been accomplished by treatment with various metal dopants, such as sulfur, selenium, iridium and platinum. See, for example, P. J. H. Burtsev et al., *Sov. Phys. - Tech. Phys.* 11, 2036 (1956), L. B. Laursen et al., *Appl. Opt.* 2, 435 (1968) and L. B. Laursen et al., *Appl. Opt.* 2, 459 (1968). In addition, it has also been disclosed that a silver halide emulsion can be sensitized by a dye. For example, Research Disclosure, May, 1988, page 249, discloses the sensitization of silver halide using various sensitizing dyes, such as, 1-phenyl-5-mercaptotetrazole, 1-(4'-m
