THETA UVC BLENDER

This article summarizes the action required in order to enable live streaming support for your THETA S or THETA m15 devices with THETA UVC BLENDER.A

phase I/II study of temsirolimus (CCI-779) in combination with dacarbazine in patients with cutaneous melanoma and lung metastases. A series of in vitro studies with temsirolimus have shown synergy between the drug and the DNA-damaging agents. Combining this drug with other DNA-

damaging agents for the treatment of cancer has been suggested. The aim of the study was to investigate the activity and toxicity of temsirolimus in combination with dacarbazine (DTIC) in patients with metastatic melanoma. Patients with melanoma and unresectable metastatic disease to the lungs

and/or lymph nodes were studied. They received temsirolimus once daily intravenously and DTIC on days 1 and 8 of each 28-day cycle. Starting doses of 70 and 90 mg/m(2) of temsirolimus were escalated in 15-20 mg/m(2) steps. The objectives of the study were to establish the

maximum-tolerated dose (MTD) and dose-limiting toxicity (DLT) of temsirolimus in combination with DTIC, to determine the activity of this combination, and to explore potential biomarkers of response to the combination. Dose escalation was stopped if the DLT rate exceeded 10%.

Nineteen patients were treated. The MTD was not reached due to DLT, which was observed at the 100 mg/m(2) dose level. The recommended phase II doses were 70 mg/m(2) temsirolimus and 75 mg/m(2) DTIC. In the intention-to-treat analysis, the median time-to-progression and overall survival were

5.2 months and 7.8 months, respectively. The most common adverse effects were grade 3/4 acneiform rash (12/19), grade 2/3 mucositis/stomatitis (10/19), asthenia (10/19), and hyperpigmentation (10/19). Temsirolimus can be safely given in combination with DTIC to adult patients with

metastatic melanoma. The recommended phase II doses are 70 mg/m(2) temsirolimus and 75 mg/m(2) DTIC.Q: b7e8fdf5c8
