I want to get the IP address of my computer as host, hostname as subdomain, and also the last octet of my IP address. I used the following, but it gives me something else. hostname "%MachineName%|%SystemDrive%|%Path%|%Domain%|%UserProfile%|%SystemRoot%|%System32%|%SystemDrive%\Windows\System32\Wmic" Get-Content -Path C:\somepath\file.txt \$IP = (Get-Content -Path C:\somepath\file.txt) -split" +" \$IP1 = (Get-Content -Path C:\somepath\file.txt) -split" " \$IP2 = \$IP -split" +" Get-WmiObject Win32\_NetworkAdapterConfiguration -ComputerName '192.168.0.1' \$IP3 = \$IP -split" " \$IP4 = (Get-WmiObject Win32\_NetworkAdapterConfiguration -ComputerName '192.168.0.1' | Select IPAddress) -split"." Get-Content -Path C:\somepath\file.txt -Raw I need to get all the IP address and hosts that I have, but I really can't figure out a way. Thanks for your time. A: Get-Content -Path C:\somepath\file.txt -Raw will only give you content in the file. you have to read the whole file into a string and then split it to get what you want. \$content = (Get-Content -Path C:\somepath\file.txt -Raw) -split "`r" | Select-Object -ExpandProperty FullName \$content | Select-String "\\." | % { \$\_.Matches } | % { \$IP = [Regex]::Match(\$\_, "^[0-9]{1,3}\.){3}[0-9]{1,3}\$" }  
Output: > \$IP Id Number
