To evaluate the safety and efficacy of robotic radical cystectomy (RRC) by multi-center analysis. We retrospectively collected the clinical and follow-up data of 844 patients with bladder cancer who underwent RRC from 14 centers in China from Jan. 2010 to Dec. 2015 and analyzed clinical features, surgical outcomes, pathological results and survival rates. The median age was 61 years (range, 35-84 years). The median follow-up time was 48 months (range, 1-60 months). Of the patients, 557(66.0%) were classified as International Union Against Cancer (UICC) grade Ta, 252(30.3%) as Ta2, and 35(4.1%) as T1. RRC was performed with intracorporeal urinary diversion in 705(83.9%), and the mean operative time and median length of hospital stay were (251±41) min and (5 d), respectively. The mean intraoperative blood loss was (454±233) ml. Postoperative complications occurred in 392(46.4%) patients,
